

Upstream Architectural Shifts: ADA Compliance in Higher Ed

Why retrofitting digital course platforms post-deployment is an expensive illusion.

The Cost of Retrofitting

- Traditional accessibility fixes happen *after* student complaints or audits.
- Results in high remediation overhead and fragmented toolsets.
- Real compliance requires upstream architectural control from day one.

The Curriculum-as-Code Model

- Treats master courses like software repositories using version-controlled Markdown.
- Automated CI linting enforces WCAG 2.2 AA standards automatically.
- Eliminates human error in accessibility formatting.

Sovereign AI Auditing

- Replacing legacy, inaccurate AI detection with student-led compliance audits.
- Students audit generated clinical outputs against rigorous federal Single Sources of Truth.
- Transforms compliance into an active cognitive skill.

Institutional Scaling

- Built for zero-cost OER accessibility in Southwest borderland institutions.
- High-contrast Navy and Creme design principles ensure universal mobile legibility.
- Scalable across Arizona Western College and regional EdTech initiatives.
